HOW WE MAKE PAPER

Thousands of years ago, people learned they could combine fibre and water into a slurry to create paper. While the basic concept has remained the same throughout the ages, today we do it on a much larger scale and at a much more advanced level of technology.

A SUSTAINABLE APPROACH FROM START TO FINISH

The main ingredient in all Catalyst paper products is renewable wood fibre that has been converted into pulp. We use responsibly sourced fibre in the form of wood chips, which are byproducts of lumber manufacturing, and pulp logs, which are poor quality logs that are unsuitable for lumber manufacturing.

We purchase fibre from suppliers in British Columbia and the US Pacific Northwest. Each of our paper mills use globally recognized chain-of-custody standards.

TURNING PULP INTO PAPER

Making paper entails mixing different pulp grades to produce product with specific end-use characteristics. We blend varying combinations of mechanical and kraft pulps along with fillers and pigments to make our papers.

Mechanical pulp is used to produce our lightweight newsprint and directory products, while kraft pulp is used in limited amounts to add strength to our specialty papers. And for brighter, whiter paper, we use higher brightness bleach pulp, using an elemental chlorine-free process.

YOUR LOCAL PAPER COMPANY

Our paper products become many of the products you use every day. Our Catalyst facilities manufacture superior-quality specialty, printing and writing, and packaging papers for retailers, commercial printers, publishers, and customers who convert our products into their own.

ABOUT US

Paper Excellence is a diversified manufacturer of pulp and specialty, printing and writing, and packaging papers. We believe in the enduring value of wood-based products in global markets, and have built a large network of mills and chipping plants to produce them competitively. Through our distinct approach to operational excellence, we deliver high-quality and cost-effective products to international customers.

Paper Excellence has a combined annual paper production capacity of 520,000 million tonnes.

HOW WE MAKE PAPER

THE PAPER MAKING PROCESS

1 MECHANICAL PULPING

Mechanical papers are manufactured with bright, raw wood chips which are mechanically ground up into pulp using refiners often powered by motors the size of locomotive engines.

2 POST-REFINING

That pulp is diluted and small woody contamination is removed with banks of cleaners.

3 SHEET FORMERS

After the pulp slurry is brightened with peroxide and other chemicals, the 99 parts water / one part wood fibre slurry is sprayed on a fast moving screen to form the paper and begin the water removal process.

4 PRESSING AND DRYING

After the formation of the paper, it is pressed through the press section of the paper machine and then dried through the dryer section using large steam heated rolls.

5 CALENDER STACK

The now-dry paper is ironed between either polished steel rolls or specially designed soft rolls. This gives the paper a smooth finish and a precise and uniform thickness that reflects customers' specifications.

6 REELS AND ROLLS

The final stage involves building a "jumbo roll" of paper and then converting that into individual rolls of varying width and diameter customized for each customer.
